

# An Introduction to Self-Monitoring, Adaptive, Re-Calculating, Treatment Technology (SMARTT) in Degassing Aluminum

Brian Began

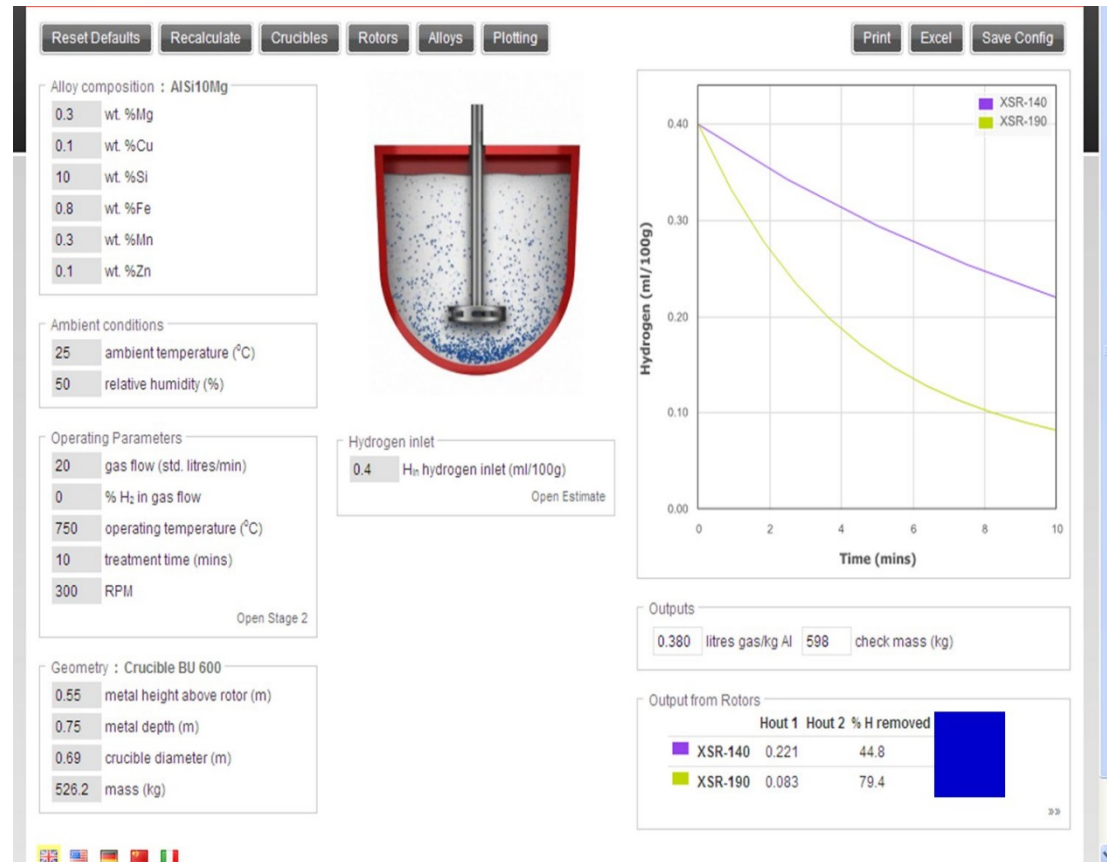

Foseco

# Outline

- Degassing model
  - Creation
  - Verification
- Degas modelling results for variations in:
  - ambient conditions
  - purge flow rates
  - rotor speeds
  - Alloys
  - Melt temperatures
- Introduction to SMARTT Degassing

# Degas Modelling

- Web based program available on a license basis to colleagues
- Available in both metric and standard imperial
- Results can be output and saved
- Includes drop down of standard crucible/ladle sizes

# Degas Modelling – Derivation & Verification

- Completed in 2011
- Tests run to identify 19 individual inputs
- Created by modelling oxygen in water using:
  - Henry's Law
  - Arrhenius relationship of O<sub>2</sub> diffusivity in water
- Adapted to aluminum using Sievert's Law
- Verified using a novel electrochemical, in situ, hydrogen sensor

# Model Assumptions

- Assumes 100% of degassing treatments properly incorporate a baffle plate to break the vortex.
- Assumes there are no leaks in the purge gas line.
- Assumes graphite consumables are in operating condition.
- Assumes equipment is fully optimized.
  - Out of round is less than .007"
  - Tachometer, flow gage, etc. properly functioning.
- Assumes issues with “flooding” rotors are avoided.

# Parameters to be Modelled

ATL 1000 with 850 kg melt		XSR 220 rotor
AlSi7Mg		420 rpm
750 °C melt temperature		20 l/min inert gas
50 % relative humidity		0.30 ml H <sub>2</sub> / 100 g Al starting level
25 °C outside temperature		

# Hydrogen Equilibrium

**Figure 2: Influence of ambient conditions on hydrogen equilibrium**  
(.005 atm.=5°C/50 % rH; 0.05 atm.=35°C/90 % rH)

# Modelling Results

Hydrogen saturation points for three different condition sets

# Modelling Results

- Models for inert flow variations (bottom left) and rotor speed variations (bottom right).

# Modelling Results

- Degassing curves for different alloys under the modelled conditions

# Modelling Results

- Models for different treatment starting temperatures (bottom left) and different initial hydrogen levels (bottom right).

# SMARTT Degassing

- **Self-Monitoring Adaptive Recalculating Treatment Technology.**
- Model integrated with a rotary degassing unit with automated flux additions.
- Several validation trials have been completed.
- Unit will tell you when a desired cycle is not possible (e.g. too low a hydrogen level for the melt temperature).

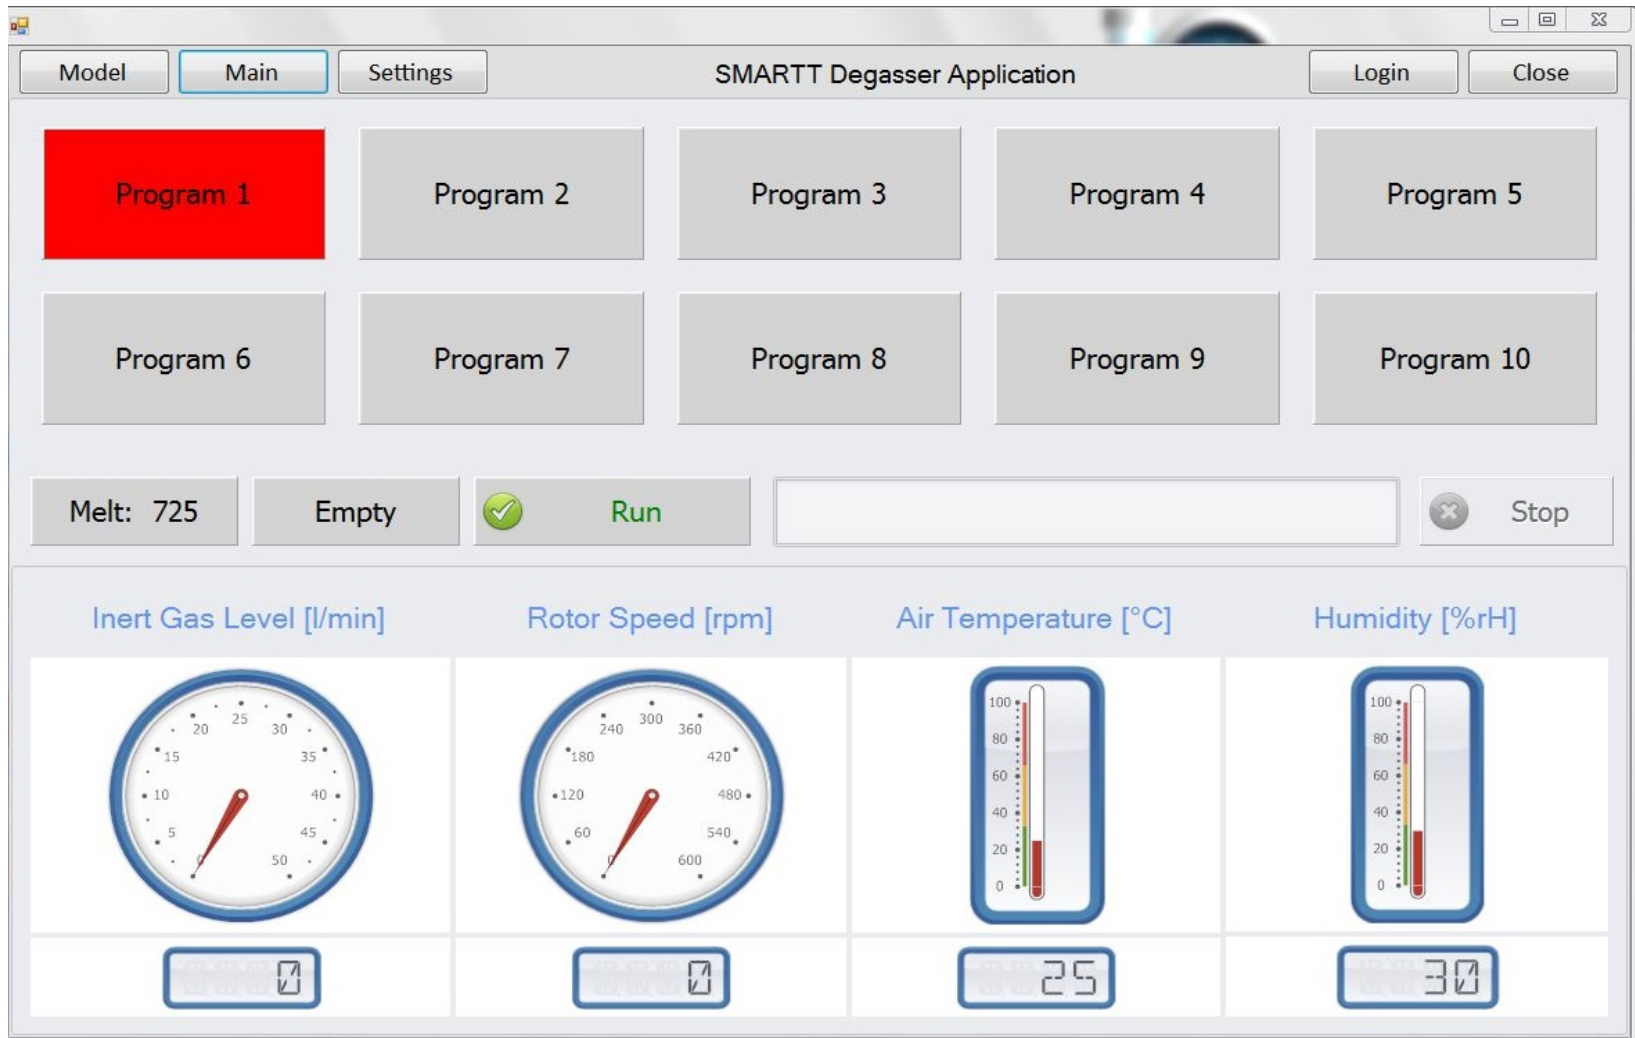

# Trial Unit Specifications

- Unit combines rotary degassing with automated treatment additions.
- The trial unit can perform multiples of the following treatments:
  - Remove hydrogen (degas)
  - Treat oxides (cleaning flux)
  - Grain refine
  - Modify eutectic with sodium
  - Remove alkalis
  - Add hydrogen (upgas)
  - Model degassing
- The subject unit uses a removable baffle, hoppers with auger feeders and PLC controls to perform and sync all of the treatments.

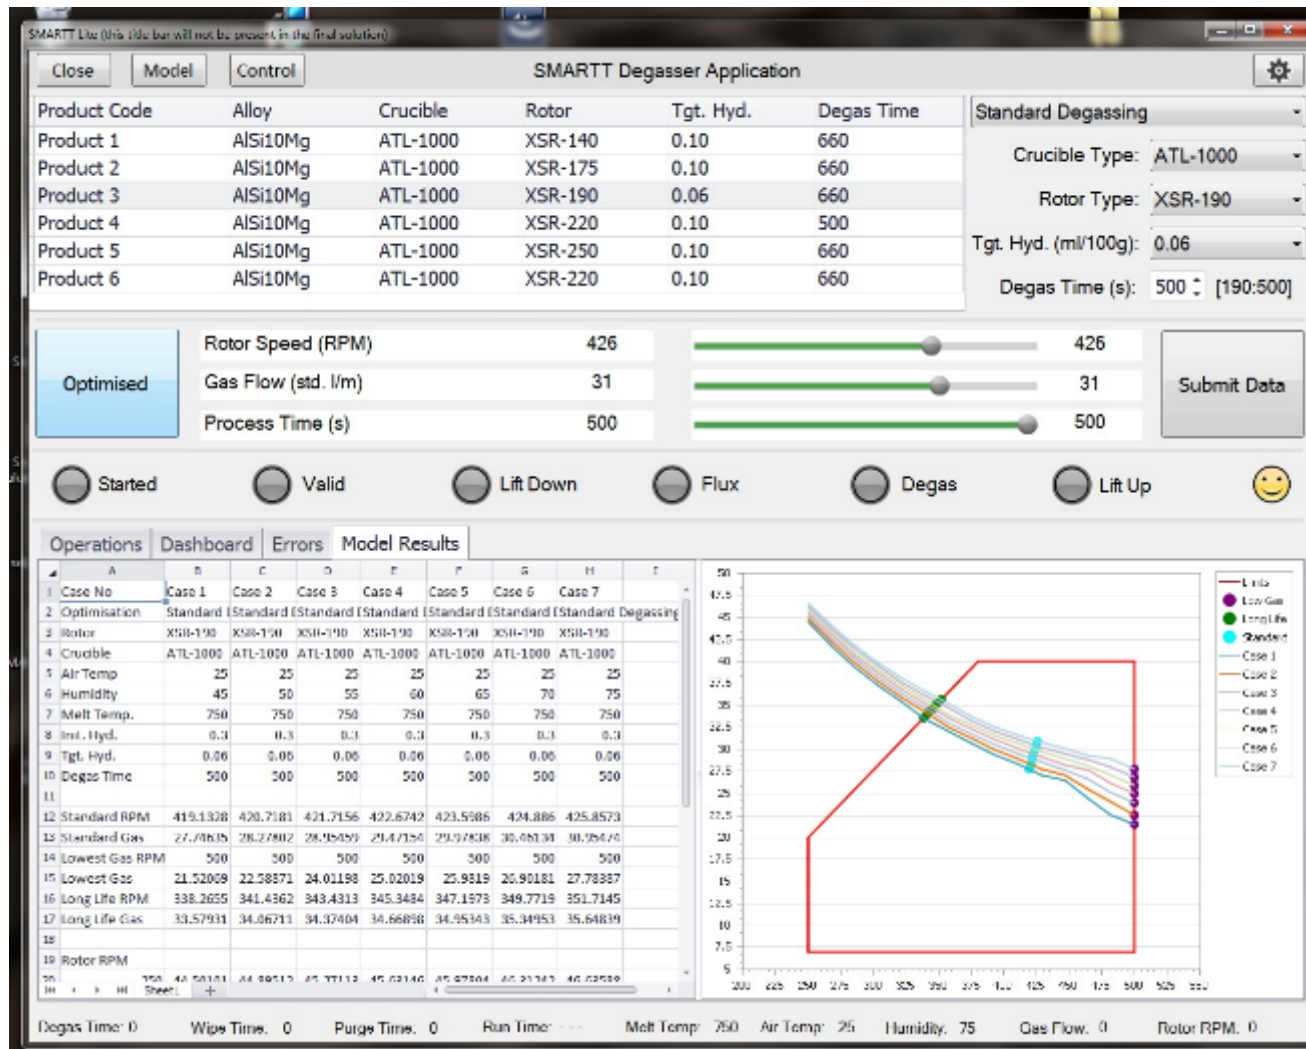

# Four Optimization Schemes

- **High-speed degassing** – shortest possible treatment time at highest possible rotor speed and inert gas flow rate. A minimum treatment time is observed to allow homogenization and oxide removal.
- **Low gas degassing** – runs the treatment for a given time at lowest gas consumption and correlative rotor speed to achieve the target.
- **Long life degassing** – runs at lowest possible rotation speed to reduce the shaft and rotor abrasion. The corresponding inert gas flow depends on the total treatment time.
- **Standard degassing** – the average of low gas and low speed provides a balance between the two extreme schemes.

# Degassing Interface - Operator

# Degassing Interface - Engineering

# Results Parameters for 4 Optimization Schemes

Optimised	Rotor Speed (RPM)	500	500
	Gas Flow (std. l/m)	29	29
Melt: 750	Process Time (s)	300	300
<i>Low gas consumption</i>			
Optimised	Rotor Speed (RPM)	426	426
	Gas Flow (std. l/m)	32	32
Melt: 750	Process Time (s)	300	300
<i>Standard degassing</i>			
Optimised	Rotor Speed (RPM)	353	353
	Gas Flow (std. l/m)	40	40
Melt: 750	Process Time (s)	300	300
<i>Long life for consumables</i>			
Optimised	Rotor Speed (RPM)	500	500
	Gas Flow (std. l/m)	45	45
Melt: 750	Process Time (s)	155	155
<i>High-speed degassing</i>			

# Effects of Ambient Temperature & Humidity

Optimised	Rotor Speed (RPM)	404		404
	Gas Flow (std. l/m)	18		18
Melt: 750	Process Time (s)	300		300
Standard degassing - 15 °C outside temperature / 30 % relative humidity				
Optimised	Rotor Speed (RPM)	426		426
	Gas Flow (std. l/m)	32		32
Melt: 750	Process Time (s)	300		300
Standard degassing - 25 °C outside temperature / 50 % relative humidity				
Optimised	Rotor Speed (RPM)	459		459
	Gas Flow (std. l/m)	44		44
Melt: 750	Process Time (s)	300		300
Standard degassing - 28 °C outside temperature / 75 % relative humidity				

# Effects of Metal Temperature

Optimised	Rotor Speed (RPM)	417		417
	Gas Flow (std. l/m)	23		23
	Process Time (s)	300		300
Melt: 700				

*Standard degassing – 700 °C melt temperature*

Optimised	Rotor Speed (RPM)	426		426
	Gas Flow (std. l/m)	32		32
	Process Time (s)	300		300
Melt: 750				

*Standard degassing – 750 °C melt temperature*

Optimised	Rotor Speed (RPM)	446		446
	Gas Flow (std. l/m)	44		44
	Process Time (s)	300		300
Melt: 780				

*Standard degassing – 780 °C melt temperature*

# Summary/conclusions

- A model was developed and verified for predicting rotary degassing effectiveness within molten aluminum alloys.
- The model can be used to identify opportunities to reduce cycle time and/or reduce purge/consumable spend.
- The model was successfully adapted to a commercial metal treatment station and several units are in use.
